

Vanity Decision Worksheet

Measure your space and weigh double against single vanity

Measure the room first

1 Measure the full wall width available

Note the space from corner to corner where the vanity will sit, including any door or window that limits it.

2 Check clearance in front of the vanity

Stand where the vanity would go and note whether two people could comfortably stand there at once.

3 Locate existing plumbing behind the wall

Note where the current supply and drain lines sit, since that affects how easily a second sink could be added.

Think about how the room is actually used

1 Count how many people use this bathroom daily

A shared primary ensuite is a different case than a guest bathroom or powder room.

2 Note whether routines overlap or stagger

Two people getting ready at the same time benefit differently from a double vanity than two people on separate schedules.

3 List what storage you actually need daily

Compare split storage under two sinks against one larger connected storage run.

Questions to bring to your consultation

1 What would a second sink involve for plumbing

Ask specifically what adding a line behind your existing wall would require.

2 How would each layout affect the rest of the room

Ask how a double vanity's footprint would affect shower, tub or storage space nearby.

3 Can I see both layouts at a similar room size

Ask to see finished examples close to your own bathroom's dimensions before deciding.

Measure first, then decide. The room usually settles the argument.
